

Brownie Quad

4 x 4

Self Propelled Work Platform

The Brownie Quad 4x4 is a self-propelled work platform with two individual platforms. These platforms have a working height that starts only 20" from the ground in the lowest

position, allowing pruning, thinning, and picking of the entire tree at a lower level to overlap ground workers. Each platform has individual controls for vertical and horizontal movement with hand or hand and foot controls. All platforms have 6' of vertical travel and two models for horizontal: standard from 5'8" to 10'8", and narrow from 4'8" to 8'8" from outside to outside of platform. The platform is powered by a 44 HP Kubota turbo diesel engine with a fully hydrostatic drivetrain which can go from 0 to 5 mph and is equipped with an automatic brake when in neutral. The planetary drives on all four wheels can be unlocked for towing with the tow bar. All controls are on the right-hand side, including a lever to hydraulically level the platform for more efficient use on side hills. This allows the driver to work along with the other three people while driving. With these many options, the platform may be utilized year-round for pruning, trellising with available wire pullers and wire unwinders, tree training, hanging pheromones, hand thinning,

and picking. With auxiliary hydraulics, it is possible to use hydraulic pruners or run a hydraulically-driven air compressor with air pruners.
